1. How to Run the Project

Technologies Used:

- .NET 10 SDK
- ASP.NET Core
- SQL Server
- Entity Framework Core

Steps:

1- After cloning the repo or downloading the zip, Open the solution (.slnx) from visual studio.

2- Configure the Database connection string from “appsettings.json” if needed
The default connection string used:

`"DefaultConnection":`

`"Server=.;Database=PlaylistManagementDb;Trusted_Connection=True;TrustServerCertificate=True;"`

If your SQL Server instance uses a different server name, update
DefaultConnection accordingly

3- Configure the JWT Secret

- Open the terminal
- Run: `cd PlaylistManagement.Api`
- To configure user secret, Run:
- `dotnet user-secrets set "Jwt:Secret"`
`"qwertyuiopasdfghjklzxcvbnm12345678910111213141516"`
You can use your user secret, must be at least 32 bytes long

- You can verify the saved Jwt:Secret by running: `dotnet user-secrets list`
- Then restore, build & run from terminal **or** directly do this from the **run**
button in visual studio

Notes:

- The JWT secret must not be committed to source control.
- The SQL Server connection string may need to be adjusted depending on the local SQL Server instance.
- The application automatically applies pending EF Core migrations on startup.

2- Project Testing Demo links

1- testing swagger endpoints

<https://drive.google.com/file/d/1PI2zeve3HCaf5yLNLIMGFvS-zmbTE67O/view?usp=sharing>

2- unit testing

https://drive.google.com/file/d/1gnC-sGUuC_DygREH5hiFu_M9Z6K8mm0z/view?usp=sharing

3- Used Resources & AI Usage

Used resources:

Some reusable code snippets and configurations from my previous .NET internship learning resources (slides) were used as references, such as the Swagger/OpenAPI configuration. These snippets were adapted to fit the current project's requirements and structure.
